

Who We Are

KATO Fertility Center - Alabang is an organized private medical facility run by highly-trained staff who underwent rigorous training and are proficient in their fields of expertise.

Our **physicians, embryologists, and nurses** underwent rigorous training in the different aspects of ART, the **Kato way**.

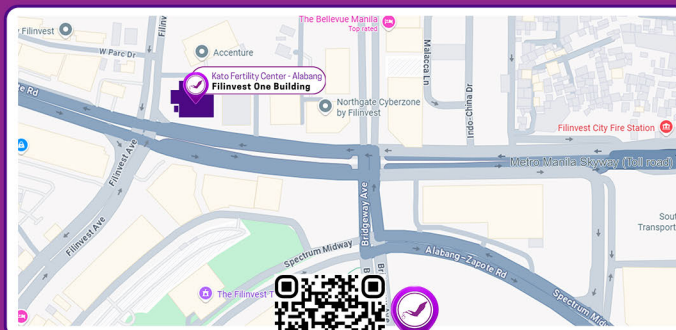

We use technology that is backed by evidence-based protocols, superior technology, and more than 30 years of experience in assisted reproductive technology (ART) by the Kato Ladies Clinic (KLC) of the Towako Group in Japan.

We offer compassionate patient care in a professional private practice environment. Originating from a well-established fertility center in Japan, **KATO Fertility Center Alabang**, has come to share this expertise and success to Filipino couples.

Location

Kato Fertility Center - Alabang is the top choice if you are looking for a trusted and reliable fertility clinic in **Muntinlupa City**.

CONCEIVE IVF MANILA INC.

A future you can conceive

Our Vision

Kato Fertility Center will be the Assisted Reproductive Technology (ART) clinic of choice for couples who want to start their families.

Our Mission

Kato Fertility Center is committed to provide safe, compassionate, and effective Assisted Reproductive Technology (ART) treatment backed by evidence-based practice and research for couples wanting to start their families.

Our Services

- **Initial Fertility Work-up** (Ultrasound, HSG, Hormone Assay, Semen Analysis, etc.)
- Intrauterine Insemination (IUI)
- In Vitro Fertilization: IVF-ICSI, Laser Assisted Hatching, Transvaginal - Ultrasound Guided Embryo Transfers
- Rescue In Vitro Maturation of Immature Eggs (IVM)
- Intracytoplasmic morphologic sperm injection (IMSI)
- (CAO) Sperm separation device
- DNA Fragmentation Test
- PGT-A, PGT-SR, PGT-M
- Embryo Culture using Time Lapse Machine with AI

Fertility Preservation

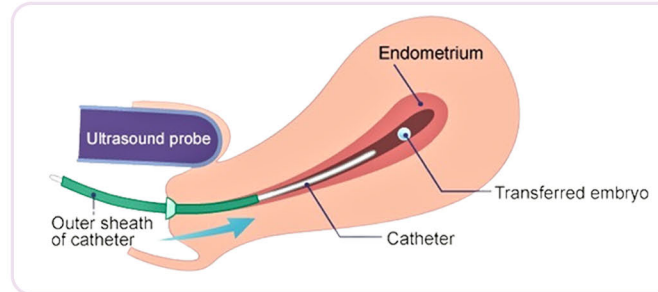

- Egg Freezing
- Sperm Freezing
- Embryo Banking
- Ovarian Tissue Cryopreservation
- Micro TESE
- Testicular Sperm Extraction (TESE)
- Percutaneous Epididymal Sperm Aspiration (PESA)

Why Kato Fertility Center?

Unique Retrieval Needle

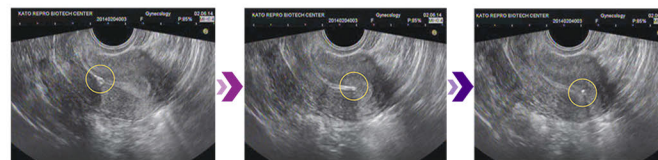

Kato Fertility Centers use its own needle developed by the company, about half the global standard thickness of OPU needles. The blade at the tip has been processed using a special technique to minimize tissue damage. This very fine needle causes minimal pain and bleeding, thus, general anesthesia is not required. With this needle, egg collection can usually be completed without causing severe pain, allowing the patient to return home after a short period of rest (approximately fifteen minutes).

Catheter used for Embryo Transfer

Ease in catheter manipulation is inversely proportional to softness, but a certain level of hardness is needed. Kato uses a catheter made of silicone about half or less in size of the ordinary catheter.

Transvaginal Ultrasound-guided Embryo Transfer

All our embryo transfers are guided by transvaginal ultrasound, hence, a more precise placement of the embryo/s into the uterus is achieved.

Patient-Friendly and Safe Protocols

Natural Cycle IVF

It is a fertility treatment approach that involves collecting and fertilizing a naturally selected egg during a woman's normal menstrual cycle, without the use of fertility medications to stimulate multiple egg development. This method relies on monitoring the woman's natural ovulation cycle and retrieving the one egg that is naturally produced each month. This method is chosen by some patients who prefer a more **natural and medication-free approach to IVF treatment**.

Minimal Stimulation IVF

It is a gentle approach to fertility treatment that uses lower doses of medications to stimulate the ovaries. It offers a more controlled and tailored approach to ovarian stimulation, potentially resulting in fewer side effects, lower risks of complications like ovarian hyperstimulation syndrome (OHSS), and **improved egg quality for fertilization** and embryo development.

High Safety Profile

The added advantage of Natural Cycle and Minimal Stimulation IVF is the reduction in the incidence of Ovarian Hyperstimulation Syndrome (OHSS).

By employing **Single Embryo Transfer (SET)**, we have reduced the twinning rate to less than 1%, thereby reducing the complications of multiple gestation.
